<b>Background</b>	v-myc avian myelocytomatosis viral oncogene neuroblastoma derived homolog(MYCN) Homo sapiens This gene is a member of the MYC family and encodes a protein with a basic helix-loop-helix (bHLH) domain. This protein is located in the nucleus and must dimerize with another bHLH protein in order to bind DNA. Amplification of this gene is associated with a variety of tumors, most notably neuroblastomas. Multiple alternatively spliced transcript variants encoding different isoforms have been found for this gene. [provided by RefSeq, Jun 2014],
<b>Other</b>	MYCN BHLHE37 NMYC, N-myc proto-oncogene protein (Class E basic helix-loop-helix protein 37) (bHLHe37)
