Conjugation			
Background	nuclear receptor subfamily 4 group A member 1(NR4A1) Homo sapiens This gene encodes a member of the steroid-thyroid hormone-retinoid receptor superfamily. Expression is induced by phytohemagglutinin in human lymphocytes and by serum stimulation of arrested fibroblasts. The encoded protein acts as a nuclear transcription factor. Translocation of the protein from the nucleus to mitochondria induces apoptosis. Multiple transcript variants encoding different isoforms have been found for this gene. Other	NR4A1, Nuclear receptor subfamily 4 group A member 1
