| Background | otoraplin(OTOR) Homo sapiens This gene encodes a member of the melanoma-inhibiting activity gene family. The encoded protein is secreted via the Golgi apparatus and may function in cartilage development and maintenance. A frequent polymorphism in the translation start codon of this gene can abolish translation and may be associated with forms of deafness. [provided by RefSeq, Jul 2013], | | |
| Other | OTOR FDP MIAL UNQ3054/PRO9873, Otoraplin (Fibrocyte-derived protein) (Melanoma inhibitory activity-like protein) | | |
