Background	programmed cell death 5(PDCD5) Homo sapiens This gene encodes a protein that is upregulated during apoptosis where it translocates rapidly from the cytoplasm to the nucleus. The encoded protein may be an important regulator of K(lysine) acetyltransferase 5 (a protein involved in transcription, DNA damage response and cell cycle control) by inhibiting its proteasome-dependent degradation. Pseudogenes have been identified on chromosomes 5 and 12 [provided by RefSeq, Dec 2010],
Other	PDCD5 TFAR19, Programmed cell death protein 5 (TF-1 cell apoptosis-related protein 19) (Protein TFAR19)
