Background	pre-mRNA processing factor 18(PRPF18) Homo sapiens Pre-mRNA splicing occurs in 2 sequential transesterification steps. The protein encoded by this gene is found to be essential for the catalytic step II in pre-mRNA splicing process. It is found in the spliceosome, and contains seven WD repeats, which function in protein-protein interactions. This protein has a sequence similarity to the yeast splicing factor Prp18. Other	PRPF18, Pre-mRNA-splicing factor 18
