<b>Background</b>	R-spondin 2(RSPO2) Homo sapiens This gene encodes a member of the R-spondin family of proteins. These proteins are secreted ligands of leucine-rich repeat containing G protein-coupled receptors that enhance Wnt signaling through the inhibition of ubiquitin E3 ligases. A chromosomal translocation including this locus that results in the formation of a gene fusion has been identified in multiple human cancers. Alternative splicing results in multiple transcript variants. [provided by RefSeq, Dec 2015],
<b>Other</b>	RSPO2 UNQ9384/PRO34209, R-spondin-2 (Roof plate-specific spondin-2) (hRspo2)
