<b>Conjugation</b>			
<b>Background</b>	<p>ubiquitin conjugating enzyme E2 A(UBE2A)      Homo sapiens      The modification of proteins with ubiquitin is an important cellular mechanism for targeting abnormal or short-lived proteins for degradation. Ubiquitination involves at least three classes of enzymes: ubiquitin-activating enzymes, ubiquitin-conjugating enzymes, and ubiquitin-protein ligases. This gene encodes a member of the E2 ubiquitin-conjugating enzyme family. This enzyme is required for post-replicative DNA damage repair, and may play a role in transcriptional regulation. Mutations in this gene are associated with mental retardation. Alternative splicing results in multiple transcript variants. [provided by RefSeq, Aug 2013],</p>		
<b>Other</b>	UBE2A/UBE2B, Ubiquitin-conjugating enzyme E2 A/Ubiquitin-conjugating enzyme E2 B
