Background	<p>5'-3' exoribonuclease 1(XRN1) Homo sapiens This gene encodes a member of the 5'-3' exonuclease family. The encoded protein may be involved in replication-dependent histone mRNA degradation, and interacts directly with the enhancer of mRNA-decapping protein 4. In addition to mRNA metabolism, a similar protein in yeast has been implicated in a variety of nuclear and cytoplasmic functions, including homologous recombination, meiosis, telomere maintenance, and microtubule assembly. Mutations in this gene are associated with osteosarcoma, suggesting that the encoded protein may also play a role in bone formation. Alternative splicing results in multiple transcript variants. Other	XRN1 SEP1, 5'-3' exoribonuclease 1 (EC 3.1.11.-) (Strand-exchange protein 1 homolog)
