Background	zinc and ring finger 1(ZNRF1) Homo sapiens This gene encodes an E3 ubiquitin-protein ligase that plays a role in neural-cell differentiation. Overexpression of this gene causes neurite-like elongation. The encoded protein contains both a zinc finger and a RING finger motif and is localized in the endosome/lysosome compartment, indicating that it may be involved in ubiquitin-mediated protein modification, and in synaptic vesicle membranes in neurons. Other	ZNRF1 NIN283, E3 ubiquitin-protein ligase ZNRF1 (EC 6.3.2.-) (Nerve injury-induced gene 283 protein) (Zinc/RING finger protein 1)
