Background	CPX chromosome region, candidate 1(CPXCR1) Homo sapiens This gene is one of several genes identified in a region of the X chromosome associated with an X-linked cleft palate (CPX) disorder. The encoded protein contains a motif similar to a motif found in zinc-finger proteins. Mutation analysis of this gene has not revealed any mutation which causes the CPX disorder. Multiple alternatively spliced variants, encoding the same protein, have been identified. [provided by RefSeq, Sep 2011],
Other	CPXCR1, CPX chromosomal region candidate gene 1 protein (Cancer/testis antigen 77) (CT77)
