<b>Background</b>	dopamine receptor D2(DRD2) Homo sapiens This gene encodes the D2 subtype of the dopamine receptor. This G-protein coupled receptor inhibits adenylyl cyclase activity. A missense mutation in this gene causes myoclonus dystonia; other mutations have been associated with schizophrenia. Alternative splicing of this gene results in two transcript variants encoding different isoforms. A third variant has been described, but it has not been determined whether this form is normal or due to aberrant splicing. [provided by RefSeq, Jul 2008],
<b>Other</b>	DRD2, D(2) dopamine receptor (Dopamine D2 receptor)
