Background	eukaryotic translation elongation factor 2(eEF2) Homo sapiens This gene encodes a member of the GTP-binding translation elongation factor family. This protein is an essential factor for protein synthesis. It promotes the GTP-dependent translocation of the nascent protein chain from the A-site to the P-site of the ribosome. This protein is completely inactivated by EF-2 kinase phosphorylation. [provided by RefSeq, Jul 2008],		
Other	EEF2 EF2, Elongation factor 2 (EF-2)
