<b>Background</b>	Fli-1 proto-oncogene, ETS transcription factor(FLI1) Homo sapiens This gene encodes a transcription factor containing an ETS DNA-binding domain. The gene can undergo a t(11;22)(q24;q12) translocation with the Ewing sarcoma gene on chromosome 22, which results in a fusion gene that is present in the majority of Ewing sarcoma cases. An acute lymphoblastic leukemia-associated t(4;11)(q21;q23) translocation involving this gene has also been identified. Alternative splicing results in multiple transcript variants. <b>Other</b>	FLI1, Friend leukemia integration 1 transcription factor
