Background	galactose mutarotase(GALM) Homo sapiens This gene encodes an enzyme that catalyzes the epimerization of hexose sugars such as glucose and galactose. The encoded protein is expressed in the cytoplasm and has a preference for galactose. The encoded protein may be required for normal galactose metabolism by maintaining the equilibrium of alpha and beta anomers of galactose.[provided by RefSeq, Mar 2009],		
Other	GALM BLOCK25, Aldose 1-epimerase (EC 5.1.3.3) (Galactose mutarotase)
