<b>Background</b>	hepatoma-derived growth factor(HDGF) Homo sapiens This gene encodes a member of the hepatoma-derived growth factor family. The encoded protein has mitogenic and DNA-binding activity and may play a role in cellular proliferation and differentiation. High levels of expression of this gene enhance the growth of many tumors. This gene was thought initially to be located on chromosome X; however, that location has been determined to correspond to a related pseudogene. Alternatively spliced transcript variants encoding distinct isoforms have been described. [provided by RefSeq, Jan 2016],		
<b>Other</b>	HDGF HMG1L2, Hepatoma-derived growth factor (HDGF) (High mobility group protein 1-like 2) (HMG-1L2)
