Background	hexamethylene bisacetamide inducible 2(HEXIM2) Homo sapiens This gene encodes a member of the HEXIM family of proteins. This protein is a component of the 7SK small nuclear ribonucleoprotein. This protein has been found to negatively regulate the kinase activity of the cyclin-dependent kinase P-TEFb, which phosphorylates multiple target proteins to promote transcriptional elongation. This gene is located approximately 7 kb downstream from related family member HEXIM1 on chromosome 17. Alternative splicing results in multiple transcript variants. [provided by RefSeq, Jan 2015],		
Other	HEXIM2 L3, Protein HEXIM2 (Hexamethylene bis-acetamide-inducible protein 2)
