<b>Background</b>	<p>Charcot-Leyden crystal galectin(CLC) Homo sapiens</p> <p>Lysophospholipases are enzymes that act on biological membranes to regulate the multifunctional lysophospholipids. The protein encoded by this gene is a lysophospholipase expressed in eosinophils and basophils. It hydrolyzes lysophosphatidylcholine to glycerophosphocholine and a free fatty acid. This protein may possess carbohydrate or IgE-binding activities. It is both structurally and functionally related to the galectin family of beta-galactoside binding proteins. It may be associated with inflammation and some myeloid leukemias. [provided by RefSeq, Jul 2008],</p>		
<b>Other</b>	CLC, Eosinophil lysophospholipase (EC 3.1.1.5) (Charcot-Leyden crystal protein) (CLC) (Galectin-10) (Gal-10) (Lysolecithin acylhydrolase)
